Detection of Hepatitis C Virus RNA

Inventors: Monique R. Ferguson; Guangyu Li

Description:
The methods and compositions of this invention provide a means for determining the presence of Hepatitis C virus (HCV) in a sample from an individual. This is accomplished by hybridization to tissue samples using a cRNA probe that is specific for HCV. These means allow superior detection of HCV infection by virtue of the RNA riboprobe.

Patent Status: Patent Pending USSN 12/802,981
