Method and Biomarkers for the Detection of Dengue Hemorrhagic Fever

Inventors: Tadeusz Kochel, Josefina Nores Garcia, Allan Brasier, Adrian Recinos, John E Wiktorowicz, Heidi Spratt, Hyunsu Ju

Description:
The present invention provides methods for detecting, analyzing, and identifying biomolecules used to identify patients with dengue-like symptoms who are at risk of Dengue Hemorrhagic Fever (DHF). The inventive method comprises detecting in a sample from a dengue infected patient one or more biomarkers selected from the group consisting of IL-10, fibrinogen, C4A, immunoglobulin, tropomyosin, and three isoforms of albumin, and which are used in a predictive MARS model to detect patients at risk of developing DHF.

Patent Status: Patent Pending
