Antibodies That Bind Tau Oligomers

Inventor: Rakez Kayed

Description:
Embodiments of this invention are directed to compositions and methods related to Tau oligomers and Tau oligomer specific antibodies. Tau oligomer monoclonal antibodies (TOMA) can be used to analyze Tau oligomers in animal models and humans, as well as biological fluids from patients with or suspected of having tauopathies such as Alzheimer's disease (AD) and many neurodegenerative diseases, including Pick's disease (PiD), progressive supranuclear palsy (PSP), corticobasal degeneration (CBD), and frontotemporal lobar degeneration (FTLD) using TOMA in ELISA assay.
