Neurotoxin Therapy for Postprandial Hyperglycemia

Inventor: Pankaj J. Pasricha

Description:
Botulinum toxin is increasingly being injected into visceral smooth muscle for a variety of indications. The present invention discloses intragastric administration of botulinum toxin to delay gastric emptying with the aim of inducing satiety and promoting weight-loss. The present invention also discloses the effects of intragastric administration of Botulinum toxin in reducing post-prandial hyperglycemia in patients suffering from Diabetes Mellitus.
