SIRNA Inhibition of PI3K P85, P110, and AKT2 and methods of use

Inventors: Mark Evers, Piotr G. Rychahou

Description:
The present invention provides polynucleotides, compositions including polynucleotides, and the uses thereof for treating cancer in a subject. The polynucleotides silence the expression of coding regions that encode polypeptides such as p85.alpha., p110.alpha., and Akt2. The cancers treatable using the methods described herein include colorectal cancer, breast cancer, lung cancer, and metastases thereof.

Patent Status: US 8198252
