01.38 - Infection Control Risk Assessment (ICRA) for Healthcare Construction Renovation and Demolition Policy

Purpose	To provide patient and employee safety guidelines in relation to construction and renovation activities in health care settings. The recommendations below are based on the American Society for Health Care Engineering (ASHE) ICRA 2.0 recommendations.
Audience	The following guidelines are for all UTMB and contract employees involved in hospital construction, renovation, and demolition, including but not limited to: Business Operations and Facilities including Environmental Health & Safety, Facilities Design and Construction, and Property Services, Healthcare Epidemiology and Infection Control, Nursing, and Health System Leadership
Infection Control Risk Assessment (ICRA)	<p>A. A Preconstruction Risk Assessment (PCRA; Policy 08.01.17) will be performed to determine the need for an Infection Control Risk Assessment (ICRA) prior to planning for any renovation, construction, or demolition project in or near any UTMB Healthcare facility (Appendix A & Appendix B).</p> <p>B. Activities limited to above ceiling will follow Policy 08.01.23 "Above Ceiling Work Policy". Following the Above Ceiling Work Risk Matrix, Class I, II & III permits are excluded from requiring an ICRA plan and must follow predetermined precautions (Appendix C).</p> <p>C. Activities that require class 1 and 2 precautions, although may not require an ICRA, must follow the required standard mitigation measures found in Appendix D.</p> <p>D. An ICRA plan will be required for precautions class 3 and above at the time of the ICRA permit submission unless otherwise approved by a representative from ICHE (Appendix E).</p> <p>E. The Institutional Master specifications must be reviewed and be in accordance with the most up-to-date Healthcare Construction, Renovation, and Demolition policy.</p> <p>F. The ICRA must be reviewed and approved by representatives from the Department of Healthcare Epidemiology (ICHE) a minimum of 7-10 days prior to the anticipated start date.</p> <p>G. An ICRA approval for emergent work will be prioritized following notification to an ICHE representative.</p> <p>H. Multiple-phase projects with varying precaution risk levels will require different permits for each phase.</p> <p>I. At a minimum, safety mitigation measures identified in the risk matrix (Appendix F) will be required to ensure patient, staff, visitor, and contractor safety. If necessary, ICHE will communicate any additional required measures.</p> <p>J. Only authorized persons will be allowed to enter the construction zone.</p>

Section: UTMB On-line Documentation Subject: Infection Control & Healthcare Epidemiology Policies and Procedures Topic: 01.38 - Infection Control Risk Assessment (ICRA) for Healthcare Construction Renovation and Demolition Policy	01.38 - Policy 9.6.23 - Revised 2002 - Author
--	--

	<p>K. Signage must direct pedestrian traffic away from construction areas.</p> <p>L. Compliance with ICRA safety precautions must be verified and documented twice daily. During time periods when no work is occurring, the area must be documented as “Made Safe”.</p> <p>M. After completion of renovation/construction, all water pipes in renovation/construction areas will be adequately flushed, as indicated by the water quality plan.</p>
Special Patient Considerations	<p>A. Patients should be transported to areas in the hospital where they have diagnostic or therapeutic procedures by routes that minimize their exposure to construction sites.</p> <p>B. Immunocompromised patients</p> <ol style="list-style-type: none"> 1) Prior to any construction/renovation or cable pulls the Nurse Manager of the unit will be notified by the construction manager or permit authorizing individuals that approve Above Ceiling Work Permits. 2) Prior to the initiation of the work the patients on the unit will be assessed by the Nurse Manager. 3) Patients who have severe congenital or acquired immune deficiency (e.g., organ transplantation, chemotherapy for cancer, advanced HIV, severe immune suppressive therapy, severe neutropenia) must be moved to the opposite wing of the hospital or another floor prior to the initiation of the work. Opinion from infection control or infectious disease physician may be sought to help assess the immune suppression status. 4) If the patients cannot be moved because of bed capacity or illness, the renovations will be postponed.
Education and Accountability	<p>A. ICRA permit must be posted at the jobsite or carried by facility and contractor personnel while performing work.</p> <p>B. Facility and contractor workers should be educated about:</p> <ol style="list-style-type: none"> 1) Infectious hazards they may encounter during the renovation/construction at the pre-construction conference conducted by Business Operations and Facilities (BOF). 2) The various infection control precaution classes and quality assurance measures prior to the start of work. <p>C. Individual worker(s) and subcontractor(s) education will be provided by the general contractor and must be in alignment with UTMB policies and procedures.</p> <p>D. Contractor education must be documented and completed annually.</p>

Section: UTMB On-line Documentation Subject: Infection Control & Healthcare Epidemiology Policies and Procedures Topic: 01.38 - Infection Control Risk Assessment (ICRA) for Healthcare Construction Renovation and Demolition Policy	01.38 - Policy 9.6.23 - Revised 2002 - Author
--	--

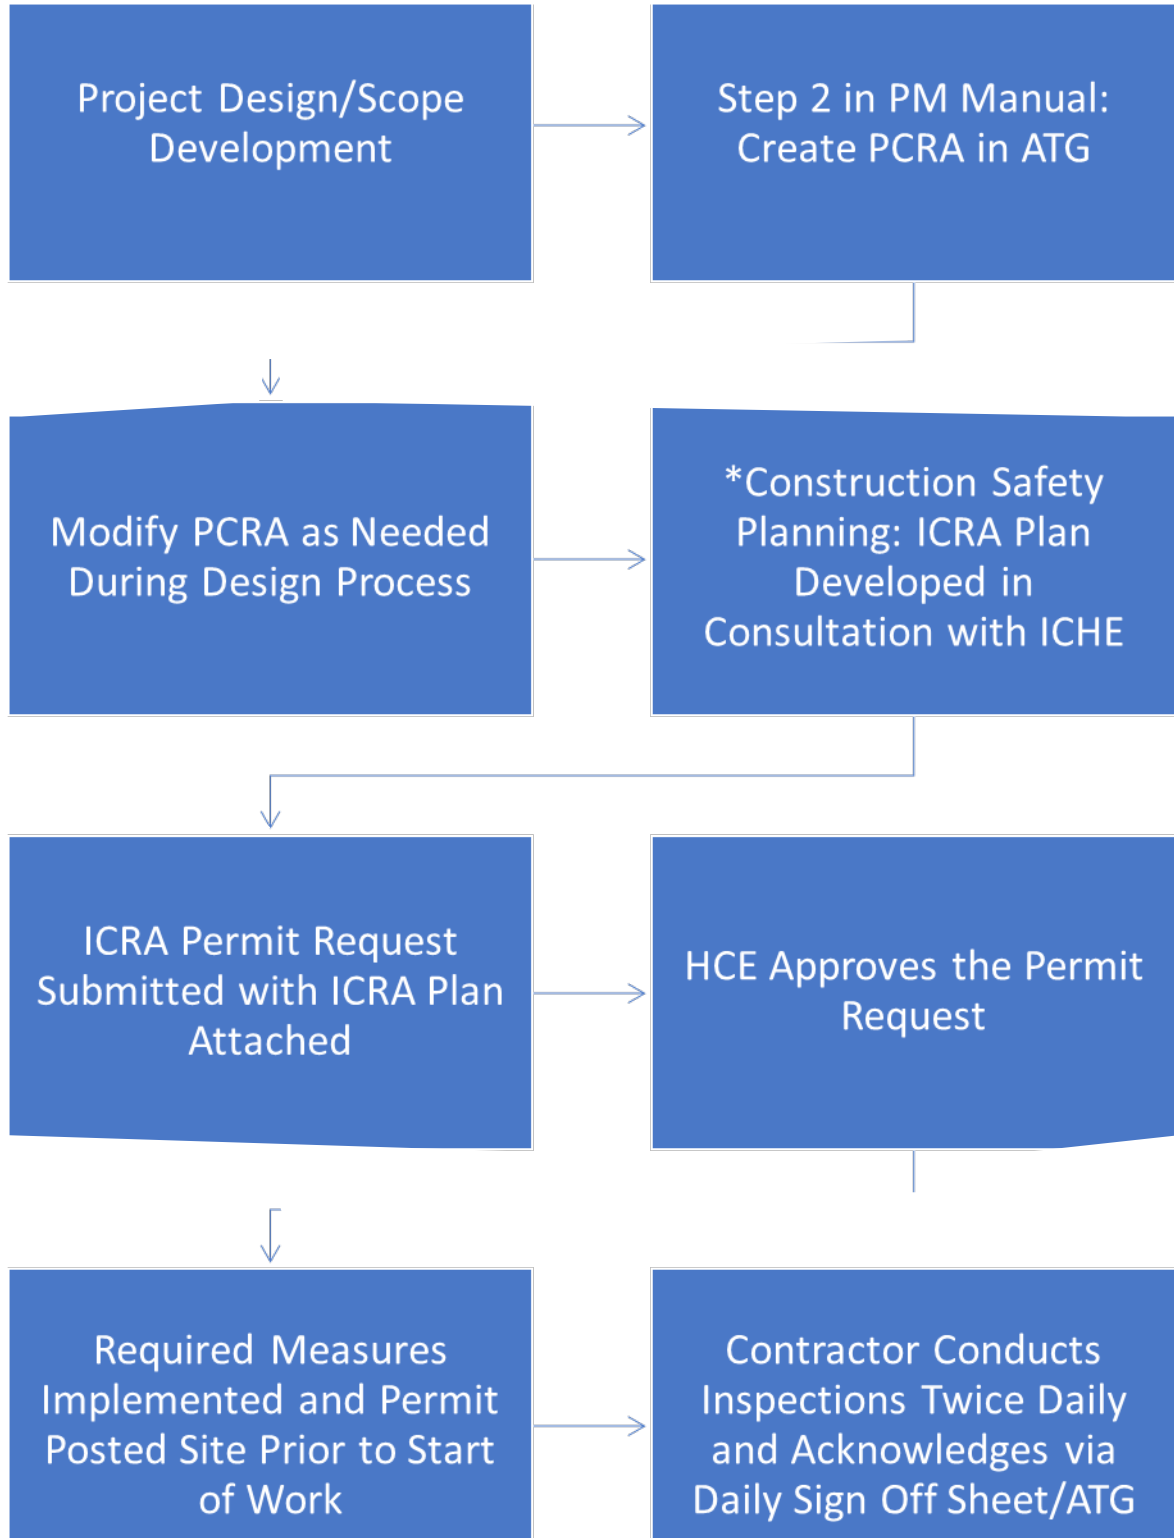

Monitoring for Contamination	<p>Monitoring for contamination/infection during and after renovation/construction.</p> <p>A. The following quality assurance measures may be taken as deemed appropriate by the Department of Healthcare Epidemiology for activities class 3 and above:</p> <ol style="list-style-type: none"> 1) Air cultures 2) Particulate data 3) Water samples <p>B. Continuous surveillance for infections related to renovation/construction will be done as deemed appropriate by the Department of Healthcare Epidemiology. Criteria for acceptable air quality in different types of patient care units are as follows:</p> <ol style="list-style-type: none"> 1) Medical/Surgical patient care units <ol style="list-style-type: none"> a) Total spore counts \leq 15 spores per cubic meter of air. b) Total pathogenic spore counts \leq 3 spores per cubic meter of air. <ol style="list-style-type: none"> (i) <i>Aspergillus</i> species (ii) <i>Zygomycete</i> species (iii) <i>Fusarium</i> species 2) Intensive care units, transplant units, oncology units <ol style="list-style-type: none"> a) Total spore counts \leq 15 spores per cubic meter of air. b) No spores of pathogenic fungal species 3) Operating rooms <ol style="list-style-type: none"> a) Total spore counts \leq 3 spores per cubic meter of air. b) No spores of pathogenic fungal species

Minimum Required Infection Control Precautions by Class | Before and During Work Activity

Class of Precautions	Mitigation Activities (Performed Before and During Work Activity)
Class I	<ol style="list-style-type: none"> 1. Perform noninvasive work activity as to not block or interrupt patient care. 2. Perform noninvasive work activities in areas that are not directly occupied with patients. 3. Perform noninvasive work activity in a manner that does not create dust. 4. Immediately replace any displaced ceiling tile before leaving the area and/or at end of noninvasive work activity.
Class II	<ol style="list-style-type: none"> 1. Perform only limited dust work and/or activities designed for basic facilities and engineering work. 2. Perform limited dust and invasive work following standing precautions procedures approved by the organization. 3. This Class of Precautions must never be used for construction or renovation activities.
Class III	<ol style="list-style-type: none"> 1. Provide active means to prevent airborne dust dispersion into the occupied areas. 2. Means for controlling minimal dust dispersion may include hand-held HEPA vacuum devices, polyethylene plastic containment, or isolation of work area by closing room door. 3. Remove or isolate return air diffusers to avoid dust from entering the HVAC system. 4. Remove or isolate the supply air diffusers to avoid positive pressurization of the space. 5. If work area is contained, then it must be neutrally to negatively pressurized at all times (-0.02 WC). 6. Seal all doors with tape that will not leave residue. 7. Contain all trash and debris in the work area. 8. Nonporous/smooth and cleanable containers (with a hard lid) must be used to transport trash and debris from the construction areas. These containers must be damp-wiped cleaned and free of visible dust/debris before leaving the contained work area. 9. Install an adhesive (dust collection) mat at entrance of contained work area based on facility policy. Adhesive mats must be changed routinely and when visibly soiled. 10. Maintain clean surroundings when area is not contained by damp mopping or HEPA vacuuming surfaces.
Class IV	<ol style="list-style-type: none"> 1. Construct and complete critical barriers meeting NFPA 241 requirements including: Barriers must extend to the ceiling or, if ceiling tile is removed, to the deck above, and all penetrations through the barrier shall meet the appropriate fire rating requirements. 2. All (plastic or hard) barrier construction activities must be completed in a manner that prevents dust release. Plastic barriers must be effectively affixed to ground and ceiling and secure from movement or damage. Apply tape that will not leave a residue to seal gaps between barriers, ceiling, or floor. 3. Seal all penetrations in containment barriers, including floors and ceiling, using approved materials (UL schedule firestop if applicable for barrier type). 4. Containment units or environmental containment units (ECUs) approved for Class IV precautions in small areas totally contained by the unit and that has HEPA-filtered exhaust air. 5. Remove or isolate return air diffusers to avoid dust entering the HVAC system. 6. Remove or isolate the supply air diffusers to avoid positive pressurization of the space. 7. Negative airflow pattern must be maintained from the entry point to the anteroom and into the construction area. The airflow must cascade from outside to inside the construction area. The entire construction area must remain negatively pressurized at -0.02 WC. 8. Maintain negative pressurization of the entire workspace by use of HEPA exhaust air systems directed outdoors. Exhaust discharged directly to the outdoors that is 25 feet or greater from entrances, air intakes and windows does not require HEPA-filtered air. 9. If exhaust is directed indoors, then the system must be HEPA filtered. Prior to start of work, HEPA filtration must be verified by particulate measurement as no less than 99.97% efficiency and must not alter or change airflow/pressure relationships in other areas. 10. Exhaust into shared or recirculating HVAC systems, or other shared exhaust systems (e.g., bathroom exhaust) is not acceptable. 11. Install device on exterior of work containment to continually monitor negative pressurization. To assure proper pressure is continuously maintained, it is recommended that the device(s) have a visual pressure indicator. 12. Contain all trash and debris in the work area.

--	--

	<ol style="list-style-type: none"> 13. Nonporous/smooth and cleanable containers (with a hard lid) must be used to transport trash and debris from the construction areas. These containers must be damp-wiped cleaned and free of visible dust/debris before leaving the contained work area. 14. Worker clothing must be clean and free of visible dust before leaving the work area. HEPA vacuuming of clothing or use of cover suits is acceptable. 15. Workers must wear shoe covers prior to entry into the work area. Shoe covers must be changed prior to exiting the anteroom to the occupied space (non-work area). Damaged shoe covers must be immediately changed. 16. Install an adhesive (dust collection) mat at entrance of contained work area based on facility policy. Adhesive mats must be changed routinely and when visibly soiled. 17. Consider collection of particulate data during work to monitor and ensure that contaminants do not enter the occupied spaces. Routine collection of particulate samples may be used to verify HEPA filtration efficiencies.
Class V	<ol style="list-style-type: none"> 1. Construct and complete critical barriers meeting NFPA 241 requirements including: Barriers must extend to the ceiling, or if ceiling tile is removed, to the deck above, and all penetrations through the barrier shall meet the appropriate fire rating requirements. 2. All (plastic or hard) barrier construction activities must be completed in a manner that prevents dust release. Plastic barriers must be effectively affixed to ground and ceiling and secure from movement or damage. Apply tape that will not leave a residue to seal gaps between barriers, ceiling, or floor. 3. Seal all penetrations in containment barriers, anteroom barriers, including floors and ceiling using approved materials (UL schedule firestop if applicable for barrier type). 4. Construct anteroom large enough for equipment staging, cart cleaning, workers. The anteroom must be constructed adjacent to entrance of construction work area. 5. Personnel will be required to wear disposable coveralls at all times during Class V work activities. Disposable coveralls must be removed before leaving the anteroom. 6. Remove or isolate return air diffusers to avoid dust entering the HVAC system. 7. Remove or isolate the supply air diffusers to avoid positive pressurization of the space. 8. Negative airflow pattern must be maintained from the entry point to the anteroom and into the construction area. The airflow must cascade from outside to inside the construction area. The entire construction area must remain negatively pressurized at -0.02 WC. 9. Maintain negative pressurization of the entire workspace using HEPA exhaust air systems directed outdoors. Exhaust discharged directly to the outdoors that is 25 feet or greater from entrances, air intakes and windows does not require HEPA-filtered air. 10. If exhaust is directed indoors, then the system must be HEPA filtered. Prior to start of work, HEPA filtration must be verified by particulate measurement as no less than 99.97% efficiency and must not alter or change airflow/pressure relationships in other areas. 11. Exhaust into shared or recirculating HVAC systems, or other shared exhaust systems (bathroom exhaust) is <u>not acceptable</u>. 12. Install device on exterior of work containment to continually monitor negative pressurization. To assure proper pressure is continuously maintained, it is recommended that the device(s) have a visual pressure indicator. 13. Contain all trash and debris in the work area. 14. Nonporous/smooth and cleanable containers (with a hard lid) must be used to transport trash and debris from the construction areas. These containers must be damp-wiped cleaned and free of visible dust/debris before leaving the contained work area. 15. Worker clothing must be clean and free of visible dust before leaving the work area anteroom. 16. Workers must wear shoe covers prior to entry into the work area. Shoe covers must be changed prior to exiting the anteroom to the occupied space (non-work area). Damaged shoe covers must be immediately changed. 17. Install an adhesive (dust collection) mat at entrance of contained work area based on facility policy. Adhesive mats must be changed routinely and when visibly soiled. 18. Consider collection of particulate data during work to monitor and ensure that contaminants do not enter the occupied spaces. Routine collection of particulate samples may be used to verify HEPA filtration efficiencies.

Appendix C: Permitting Evaluation Flow Chart

Appendix D: Class I and Class II Precautions

The following precautions must be strictly adhered to for projects where an ICRA or Above Ceiling Permit is not required.

1. Protect patient care areas from activity or close access to the work area.
2. Minimize dust and dirt.
3. Keep the work area clean.
4. If removing ceiling tiles, replace promptly, before leaving the area unattended and/or at the end of work activity
5. Food is prohibited in work area.
6. Tools and parts shall be covered, except when in use.
7. Use a clean tightly covered container to remove debris, when applicable.
8. HEPA vacuum or damp wipe and mop work areas at end of day when work is complete.
9. Upon completion of work, clean all surfaces with hospital-approved disinfectant.

Noise & Vibration Mitigation Strategies				
<ul style="list-style-type: none">  Use diamond drills instead of powder-actuated fasteners.  Schedule noise-making periods with adjacent spaces.  Use beam clamps instead of shot.  Prefab where possible.  Use tin snips to cut metal studs instead of using a chop saw.  Install metal decking with vent tabs, then use cellular floor deck hangers.  Consider compression style fittings instead of soldering, brazing, or welding.  Wet core drill instead of dry core or percussion.  Instead of jackhammering concrete, use wet diamond saws.  Use HEPA vacuums instead of standard wet/dry vacuums.  Use mechanical joining system sprinkler fittings instead of threaded.  Where fumes are tolerated, use chemical adhesive remover (flooring glue) instead of mechanical.  To remove flooring, consider abrasive blasting instead of using a floor scraper.  Use electric sheers instead of reciprocating saw for ductwork cutting.  Install exterior man/material lifts. 				
Ventilation & Pressurization Mitigation Strategies				
<ul style="list-style-type: none">  HEPA to exterior.  Install temporary ductwork.  Utilize temporary HVAC equipment.  Vacate the area.  Install temporary partitions.  Use carbon filtration to filter odors. 				
Impact to Other Systems Mitigation Strategies				
<ul style="list-style-type: none">  Schedule outages.  Provide temporary systems.  Back-feed electricity or medical gases.

Part 4: Project Phasing

Dates (Start-End)	Phase name	Location(s) (Room #)	Area (m ³)	Patient Risk Group	Type of Activity	Class Precautions
				Type A: Low Risk	Level 1: Non-invasive	I II III IV V
				Type B: Medium Risk	Level 2: Small-scale, short duration	I II III IV V
				Type C: Medium to High Risk	Level 3: Large-scale, longer duration	I II III IV V
				Type D: High Risk	Level 4: Major demolition, construction	I II III IV V

Part 5: Preconstruction Air Quality

Room Number	Area Description	Date Sample Collected	Air Culture Results	Date Sample Collected	Particulate Count

Part 6: Preconstruction Water Quality

Room Number	Chlorine meter required? (Y/N)	Chloroform count	PH	Water Temperature	Flushing schedule

Part 7: Mitigation Activities Approaching Project Turnover

Class of Precautions	Mitigation Activities (Performed upon Completion of Work Activity)
Classes I, II and III	<p>Cleaning:</p> <ol style="list-style-type: none"> 1. Clean work areas including all environmental surfaces, high horizontal surfaces, and flooring materials. 2. Check all supply and return air registers for dust accumulation on upper surfaces as well as air diffuser surfaces. <p>HVAC Systems:</p> <ol style="list-style-type: none"> 1. Remove isolation of HVAC system in areas where work is being performed. Verify that HVAC systems are clean and operational. 2. Verify the HVAC systems meet original airflow and air exchange design specifications.
Classes III, IV and V	<p>Class III (Level 3 Activities only), IV, and V precautions require inspection and documentation for downgraded ICRA precautions.</p> <p>Construction areas must be inspected by an infection preventionist or designee and engineering representative for discontinuation or downgrading of ICRA precautions.</p> <p>Work Area Cleaning:</p> <ol style="list-style-type: none"> 1. Clean work areas including all environmental surfaces, high horizontal surfaces, and flooring materials. 2. Check all supply and return air registers for dust accumulation on upper surfaces as well as air diffuser surfaces. <p>Removal of Critical Barriers:</p> <ol style="list-style-type: none"> 1. Critical barriers must remain in place during all work involving drywall removal, creation of dust and activities beyond simple touch-up work. The barrier may NOT be removed until a work area cleaning has been performed. 2. All (plastic or hard) barrier removal activities must be completed in a manner that prevents dust release. Use the following precautions when removing hard barriers: <ol style="list-style-type: none"> i. Carefully remove screws and painter tape. ii. If dust will be generated during screw removal, use hand-held HEPA vacuum. iii. Drywall cutting is prohibited during removal process. iv. Clean all stud tracks with HEPA vacuum before removing outer hard barrier. v. Use a plastic barrier to enclose area if dust could be generated. <p>Negative Air Requirements:</p> <ol style="list-style-type: none"> 1. The use of negative air must be designed to remove contaminants from the work area. 2. Negative air devices must remain operational at all times at a minimum of -0.02 WC and in place for a period after completion of dust creating activities to remove contaminants from the work area and before removal of critical barriers. <p>HVAC systems:</p> <ol style="list-style-type: none"> 1. Upon removal of critical barriers, remove isolation of HVAC system in areas where work is being performed. 2. Verify that HVAC systems are clean and operational. 3. Verify the HVAC systems meets original airflow and air exchange design specifications.

Part 8: Room Turnover Template

Suggested Turnover Sequence for Medium/High-Risk Areas	
Construction Clean	Including:
	Remove HVAC Filters or plastic from over HVAC and damp clean to ensure the cleanliness of supply and return/exhaust grills
	Clean ceiling tiles and grid with disinfectant and with a HEPA vacuum. Cleaning of all fire sprinklers and detection devices must be coordinated with Environmental Health & Safety.
	Water flush
	Clean floor, walls, and other affected surfaces with disinfectant and with HEPA vacuum
Terminal clean with bleach - EVS	
Remove Negative pressure set up; maintain HEPA air scrubber and barriers: Switch out to clean HEPA air scrubber	Grouped together
Air balancing	
Punch out items	
Terminal clean with bleach - EVS	No activity permitted in space following Terminal Clean
ICHE – Inspection and/or Air cultures (if applicable)	
Barrier removal once Air Cultures cleared by ICHE	
Terminal clean prior to occupancy - EVS	

Appendix F: Safety Mitigation Options

Asterisked items must be included in drawings and ICRA Plan during ICRA permit submission.

Minimum Safety Measures:

- ICRA Permit posted at the job site or immediately available.
- Separate patient care areas from activity or close access to work area.
- Minimize dust and dirt.
- Keep work area clean.
- If removing ceiling tiles, replace promptly.
- Food prohibited in work area.
- Use clean tightly covered container to remove debris, when applicable. For large projects, wipe cart clean prior to leaving work area and before re-entering hospital after dumping (may require keeping cleaning supplies at dock).
- HEPA vacuum or damp wipe and mop work areas at end of day and when work is complete.
- Upon completion of work, clean all surfaces with hospital approved disinfectant.

Equipment and Supplies:

- Remove all equipment and material from room prior to work.
- Cover material and equipment in room prior to work.

Containment:

- Close door to work area – the room will serve as containment, seal doors with tape*.
- Seal doors and/or enclose work area with approved mobile containment.
- Seal doors and/or enclose work area with approved HEPA filtered mobile containment.
- Seal doors and/or enclose work area with approved fire-retardant polyethylene*.
- Seal doors and/or enclose work area with approved fire-retardant wall board*.
- Install plastic sheeting above the ceiling up to the ceiling deck.
- All penetrations (e.g., pipes, conduit, holes) in the construction area must be sealed to prevent migration of dust (if fire rated separation, must be sealed with equivalent material).
- All reusable containment materials and equipment must be clean prior to installation and clearance samples.

Anteroom:

- No anteroom required.
- Vestibule or anteroom required*.
- Vestibule or anteroom required with negative pressure to corridor (HEPA unit within Anteroom)*.
- Construct anteroom large enough for equipment staging, cart cleaning, workers. The anteroom must be constructed adjacent to entrance of construction work area*.

Dust Control within Anteroom:

- HEPA vacuum in anteroom with MERV 17 filter (vacuum clothing, equipment, and carts before entering public space).
- Wet rags/wipes available to wipe down equipment, carts, and materials before leaving work zone.
- Use sticky walk off mats at the exit of the job site, being careful not to create a public trip hazard.
- Wet mats for dust control with clean drying mat.

HVAC Protection and Pressure Management:

- Manometer not required.
- Manometer required and must alarm visually and audibly if pressure falls below the required level.
- Negative pressure must be maintained at -0.02-inch water column (WC). (STOP WORK if falls below -0.01 WC).
- Localized negative pressure with directional air flow in relation to worksite entrance as approved by Healthcare Epidemiology*.
- HEPA unit must be exhausted outdoors*.
- HEPA unit exhausts indoors*.
- Place MERV 14 filter over return duct and return *plenum* and MERV 8 filter exhaust air; Filter media pad over supply (required for all sheetrock removal and installation).
- Remove or isolate return air diffusers to avoid dust entering the HVAC system.
- Remove or isolate the supply air diffusers to avoid positive pressurization of the space.
- Isolate HVAC system by placing plastic or other solid material over supply and return as specified by ICHE.
- Exhaust into shared or recirculating HVAC systems, or other shared exhaust systems (e.g., bathroom exhaust) is not acceptable.

Dust Control and Terminal Cleaning:

- Use water mist to minimize dust when applicable (i.e., when cutting tile).
- Nonporous/smooth and cleanable containers (with a hard lid) must be used to transport trash and debris from the construction areas. These containers must be damp-wiped cleaned and free of visible dust/debris before leaving the contained work area.
- Worker clothing must be clean and free of visible dust before leaving the work area.
- Daily contractor clean required in adjacent areas with hospital-approved disinfectants.
- Terminal clean required at end of project.
- Clearance samples required prior to project or phase close out.
 - Healthcare Epidemiology must be notified when work is complete, and area has been disinfected before collecting clearance samples.

PPE:

- None required.
- Booties required prior to entry and exiting (shoes covers must be changed each time the worker exits the work area; stored in anteroom and off floor).
- Bunny suits, booties and hair bonnet/ hat cover required and available while dusty tasks are being performed (Stored in anteroom and off floor).
- Bunny suits, booties and hair bonnet/ hat cover required and available for duration of project (Stored in anteroom and off floor).
- Space in anteroom for donning, doffing and storage of required PPE.

Special Considerations:

- Elevator shaft access shall be sealed if located in areas undergoing construction/renovation.
- Pneumatic tube system ports will be sealed in areas undergoing construction/renovation.
