Nasotracheal Suctioning (NTS)

Purpose
To standardize the use of Nasotracheal suctioning (NTS), a component of bronchial hygiene therapy.

Scope
NTS is intended to remove accumulated secretions, blood, vomitus and other foreign material from the trachea that cannot be removed by the patient’s cough or other less invasive procedures. NTS has been used to avoid intubation that was solely intended for the removal of secretions.

NTS refers to the insertion of a suction catheter through the nasal passage and pharynx into the trachea in order to aspirate accumulated secretions or foreign material.

Audience
All licensed respiratory therapists in the Respiratory Care Services Department

Physician’s Order
Order for NTS

Indications
The need to maintain a patient airway and remove secretions or foreign material from the trachea in the presence of the inability to clear secretions, audible evidence of secretions in the large/central airways that persist in spite of patient’s best cough effort.
Possible Hazards/ Complications

- Mechanical trauma
- Hypoxia/hypoxemia
- Cardiac dysrhythmias/arrest
- Bradycardia
- Increase in blood pressure
- Hypotension
- Respiratory arrest
- Uncontrolled coughing
- Gagging/vomiting
- Laryngospasm
- Bronchoconstriction/bronchospasm
- Pain
- Nosocomial infection
- Atelectasis
- Misdirection of Catheter
- Increased ICP

</tbody>
</table>
11. Advance catheter until resistance is met (without suction applied).

12. Apply suction and rotate/withdraw catheter for a maximum of 20 seconds.

13. Frequently assess patient for oxygenation status, including pulse oximetry.

14. Re-oxygenate patient for at least 1 minute.

15. Reassess patient and repeat if necessary.

16. Documentation of procedure should be recorded in EPIC. Document per RCS policy # 7.1.1.

**Discontinuation**

Patients will be evaluated after every treatment. Based on the assessment, the therapist will make recommendations for changes in therapy or discontinuance as needed.
